

Acknowledgements

I would like to thank my supervisor Professor John Monk, for his encouragement, guidance and assistance over the past 6 years and for the many stimulating and pleasant hours spent in discussion at Walton Hall. I would also like to thank Dr Nick Heap of the Open University, for his constructive comments and feedback on an earlier draft of the thesis.

Thanks to the Metropolitan Police Operational Technical Support Unit and associated line managers, who, over the period, realised the importance of the work and allowed me the total freedom to use laboratory resources and integrate the empirical work within my normal operational and managerial duties. My thanks also go out to audio laboratory staff, who have always been supportive and bore the extra burden of the operational work that I would otherwise have carried out. I am grateful to Harvey Smith, who painstakingly prepared 70-sample recordings for blind testing and Robin How, colleague and friend, for his proof reading and total support throughout. Thanks also to my father-in-law Ronald Denny for proof reading earlier drafts.

Finally, my gratitude for the sacrifices made by my wife Tina and children Dean and Lisa, for not having me around for many weekends and evenings, when I was otherwise engrossed in books, papers and laptops.
